

World Leading Fertility Centers

Our comprehensive fertility centers offer the highest quality reproductive medicine and care

Our Centers and Staff

We offer the highest quality Reproductive Medicine performed by MD and PhD specialists

What Makes Us Different

At the Fertility Institutes, founded in 1986, we pride ourselves on the practice of Reproductive Medicine based on a solid foundation of science. We study and participate in new advances in our field, yet cast a wary eye upon many programs claiming to have "discovered" something new or revolutionary while failing to provide scientific evidence to support such claims. Sadly, such is the state of affairs in infertility practice today. We have been involved in the Assisted Reproductive Technologies (ART) from the inception of such procedures as In Vitro Fertilization (IVF), GIFT and ICSI.

Founder Dr. Jeffrey Steinberg

Dr. Steinberg, the U.S. Institutes Director, carried out his initial training at Bourne Hall Clinic at Cambridge University in England, the birthplace of In Vitro Fertilization! Dr. Steinberg worked with Drs. Patrick Steptoe and Robert Edwards, the original British pioneers of In Vitro Fertilization. Shortly after, Dr. Steinberg worked in Australia at then, the world's most successful IVF programs. Our team then returned to the U.S. to establish the third program in the United States. We have remained at the forefront of modern advance in infertility care, all the while maintaining the highest degrees of scientific credibility and avoiding the temptation of sensationalism associated with the levels of success we have enjoyed. □

Experience Counts

As a result of practicing successful Reproductive Medicine in several locations, we have been able to finely tune our approach to the complex medical details and issues involved in helping couples become new parents. We have developed a highly sophisticated computer monitoring protocol and system that allows us to track each patients treatment course with a very high degree of accuracy. We use a secured internet file transfer protocol to transmit ultrasound images and embryo development data between offices, allowing our specialists at several locations to combine their expertise and carry out daily joint case reviews on all active patients.

well as in New York and Guadalajara, patient confidentiality is a major issue for many of our clients. Each patient at the Fertility Institutes is assured the utmost in protection of their records and data. While we have shared the media spotlight on numerous occasions, in every instance, this has occurred only with the full consent, cooperation and at time request of the patients involved.

Through our volunteer efforts at the Center in Mexico, we are called upon by various pharmaceutical companies to assist in the evaluation of promising new medical treatment protocols to overcome problems such as poor responses to available fertility drugs and recurrent pregnancy loss.

For patients living in areas served by our offices, and for others considering travel to the Fertility Institutes, we feel obligated to provide the highest levels of infertility care available. It is our hope that if you are seeking medical help for an infertility problem that you will take advantage of our open offer to assist you in every way possible, even if you are not a patient of ours. We maintain and constantly strive to update this Web site to provide those seeking information about the world of infertility treatment a friendly, helpful resource to assist them in their studies.

If you or someone you know are looking for health care providers whose primary driving force is the pursuit of successful scientific accomplishment based on a foundation of compassionate concern for patients and their goals, we sincerely hope that you will consider our organization in this regard!
